RATCHET HANDLES

Clamping Handles are used when the clamping range is limited or a specific setting is required. Adjustments can be made incrementally by tightening or loosening as required.

Clamping handles have a reinforced nylon handle with cap and female brass insert or zinc plated steel threaded stud. Just depress the cap to easily park in the desired position.

Ratchet handles are also available in a heavy duty die-cast zinc plated steel handle with clamping action. Ratchets are made with steel inserts or studs and have a black oxide finish. The ratchet comes with an Allen key fixing screw. The handle can be easily disengaged by lifting the handle and moving it to the desired location to achieve required clamping pressure. The handle is spring loaded so when released it will re-engage for tightening.
